

Maximising technology. Minimising climate impact.

High-tech solutions and smart engineering are our best tools to deliver on our commitment to reduce greenhouse gas emissions. In fact, more research and development will go into the production of a barrel of oil tomorrow than a barrel produced yesterday. We are currently involved in several Carbon Capture and Storage projects - projects as diverse as In Salah in the Algerian desert, the Sleipner field in the North Sea and now Snøhvit in the Barents Sea - living examples of how our technology helps ensure that our business is environmentally aware.
